

REPORT ON THE USAGE OF *MAIDENWELL DIATOMITE* IN THE ESTABLISHMENT OF A NEW VINEYARD.

USAGE

As an experimental trial at the time of planting vines a mixture of 50 parts Maidenwell Diatomite dust + 50 parts dairy manure was placed in the hole before the vines were planted. A layer of the dust was also applied to the vines on top of the ground.

RESULT

As a result the vines planted two years ago appear to be twice the size of other vines planted several years ago in this district, the yield of fruit is quite prolific for new vines.
